

Environmental policy

The implementation of requirements for environmental protection for all processes and for all products and services is provided with the environmental management system. However, the management and all employees are included and obliged to improve the system.

The environmental management system is systematically introduced and provides the preconditions for the realization of our framework goals of environmental management, which arise from the recognition and evaluation of the following environmental aspects:

- Controlled consumption of energy products aimed at the decrease in consumption (OOC-01),
- Control of the waste and reducing the quantity of waste (OOC-02).

To achieve our goals we will:

- consider legal and other demands regarding the environmental issues,
- consider the environmental rules and organizational rules,
- ensure all the necessary activities, with which we will continuously reduce and prevent environmental pollution and ensure permanently the satisfaction of the environment in which we live,
- include all significant environmental segments in our development plans and annual business plans aimed at the continuous improvement of the environmental situation,
- train our employees who play an important role in the significant environmental aspects, and increase the environmental awareness at all employees,
- accept a commitment with clear criteria regarding the responsibility at procedures, which can threaten water, air and soil,
- inform our suppliers and contractors about our procedures, which apply to them, and require their implementation and maintenance of environmental attitudes,
- provide sufficient financial resources and other resources to improve significant environmental aspects,
- allow the interested public an insight into our environmental policy.
